

## Heating technology

### PAW modular systems

The modular heating circuits and distribution manifolds are premounted groups of fittings for heating circuits.

The single modules can be combined without any problems and can be arranged in numerous ways.

This extraordinary flexibility is achieved by the modular structure of the entire system.

This means that you can plan, install and extend distribution manifolds rapidly and professionally.

PAW offers you heating circuits for a broad range of applications:

- heating circuit
- direct / unmixed
- with 3-way mixing valve
- with 4-way mixing valve
- controlled circuit with constant value
- boiler charging set
- separation system
- extension separation system
